Notice

Service must be carried out by qualified personnel only. Any tampering carried out by unqualified personnel during the guarantee period will forfeit the right to guarantee.

For a correct operation of the instrument, after having switched off, be careful to wait at least 3 seconds before switching on again. To improve the device's specifications, the schematic diagrams may be subject to change without prior notice.

All components marked by this symbol have special safety characteristics, when replacing any of these components use only manufacturer's specified parts.

The (μ) micro symbol of capacitance value is substituted by U.

The (Ω) omega symbol of resistance value is substituted by E.

The electrolytic capacitors are 25Vdc rated voltage unless otherwise specified.

All resistors are 1/8W unless otherwise specified.

All switches shown in the "OFF" position. All DC voltages measured to ground with a voltmeter 20KOhm/V.

BIAS ADJUSTEMENT

Instruments, materials and tools:

- Audio Generator
- Dual Trace Oscilloscope with 10x prober.
- Digital Voltmeter (or Multimeter)
- 8W 1000W Resistor
- Temperature Meter

Setup:

- Connect the Audio Generator to the input and set it to output 1KHz sinusoidal signal.
- Connect the Dual Trace Oscilloscope to the input (set CH1trace at 0.5V/div. 200usec./div) and to the output (set CH2 trace at 20V/div. 200usec/div) of the amplifier. **WARNING: The oscilloscope must be earth insulated.**
- Insert the temperature sensor through the interstize between the heatsink and R15 (PTC).
- Unconnect amplifier's output from the cross-over and connect the 8W 1000W resistor instead of it.
- Insert the voltmeter terminals across R22.

ADJUSTMENT PROCEDURE

- 1) Turn on the amplifier.
- 2) Set the input signal to obtain approximately 120Vpp on the output.
- 3) When the temperature has reaches about 50°C (122°F) set the input level to minimum
- 4) Adjust the trimmer VR1 to read a voltage of 3±0.05mV on the multimeter.
- 5) Check that the voltage across the R74 resistor has the same value.
- 6) At the same temperature condition, adjust the VR2 trimmer to read 4±0.05mV across R26 resistor.
- 7) Check that the voltage on the R78 resistor has the same value.

Verifing:

- 1) Increase the input level to obtain an output voltage about of 0.5Vpp.
- 2) Check with the oscilloscope that the output signal is without a cross-talk distortion and eventually slightly adjust the VR1 position until distortion disappears. (Note: the voltage value across the R22 and across R74 resistor must not exceed 5mV)
- 3) Re-connect the cooling fan and the crossover instead of the 8W 1000W resistor.
